## Version

Chat Center dev

# 1. Preface

This document explains how to install the Chat Center module.

### IMPORTANT

This is not an actual installation guide. It is intended only to demonstrate some features of AsciiDoc, Asciidoctor, and Antora.

## 1.1. Audience

This guide is primarily intended for implementation personnel responsible for performing the initial installation of the Chat Center module, or tasked with performing an update. Secondary audiences include system administrators, security administrators, and database administrators.

### Check out our website

The latest versions of documents are available at [www.dena.io/dochub](http://www.dena.io/dochub).

## 1.2. Related documents

The following related documents are available:

Document title	Audience
Chat Center: Administration Guide	Personnel responsible for administering the system and managing users and roles.
Chat Center: User Guide	Operators and customer service representatives who regularly use the product's user interface.

## 1.3. Text conventions

Convention	Description
OK	Graphical user interface elements such as buttons.
Select <b>View</b> > <b>Zoom</b> > <b>Reset</b>	Menu cascades.

Convention	Description
<b>Bold monospace</b>	Commands, functions, processes, and parameter names.
<b>monospace</b>	File names, paths, option values.
<i>Italics</i>	Placeholder variables to be replaced by a suitable value.
<pre>class HelloWorld {     public static void main(String[] args) {         System.out.println("Hello, World!");     } }</pre>	Code examples.
highlighted text	
Ctrl + T	Keyboard entry.

## 2. Architecture

The high-level architecture of the system is depicted in the diagram below.

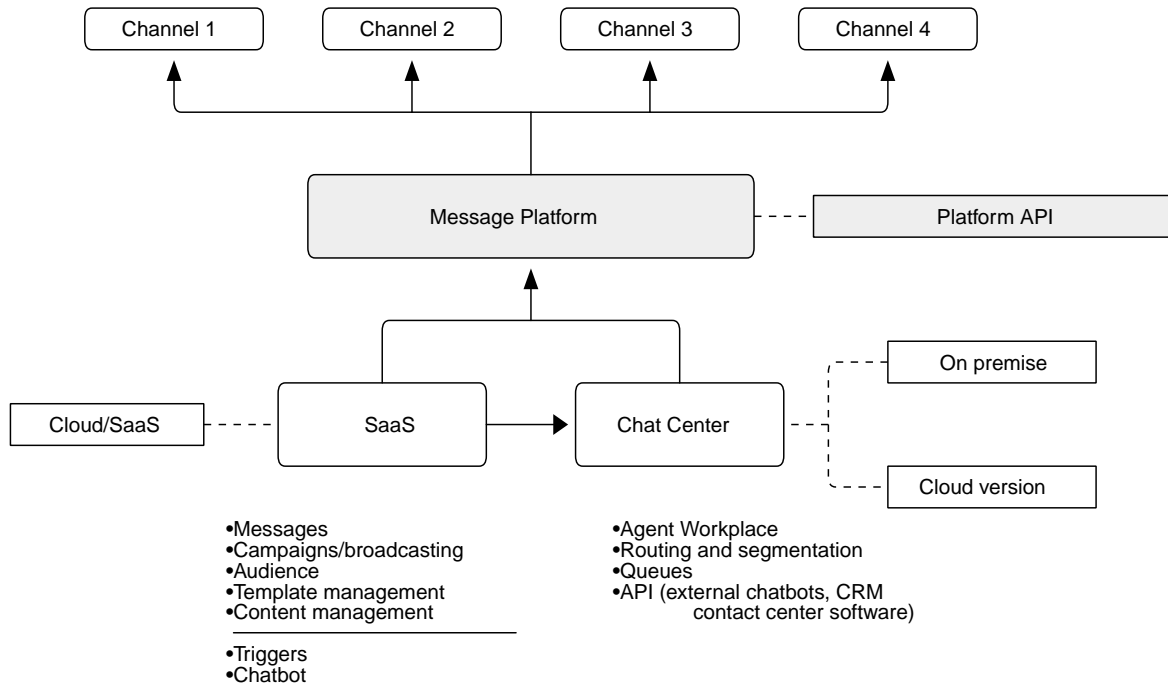

Figure 1. System architecture

**NOTE** The IM Platform and API are out of scope.

Entities	Description
<b>Channels 1–4</b>	Common messaging messaging channels.
<b>Message Platform</b>	Provides abstracted message functionality for Chat Center and SaaS via available channels.
<b>SaaS</b>	Online interface for composing and sending messages. Cloud-only.
<b>Chat Center</b>	Interface for call center personnel. On-premise and cloud options available.

### 3. Prerequisites

The following software must be installed before performing the installation of the Chat Center module:

- Java Runtime Environment (JRE) 1.8
- Oracle RDBMS 11 or greater

## 4. Installation

The installation of the Scoring module is performed in multiple steps:

1. [Creating the database](#)
2. [Configuring the database connections](#)
3. [Creating the base objects](#)
4. [Starting the user console](#)

### 4.1. Creating the database

The parameters used in the application are stored in the scoring database.

1. Access the `config.xmlDena\db` folder.
2. Execute `create_db.sql`

The database is created after the SQL script has completed.

### 4.2. Configuring the database connections

The connection details to the database need to be specified so that the operator can access the database from the console.

1. Access the folder.
2. In the root of the folder, edit the `config.xml` file.

An example of a `config.xml` file is presented below (note that it is possible to highlight specific lines of code):

```
<configuration>
  <environments default="development">
    <environment id="development">
      <tranManager type="JDBC"/>
      <dataSource type="POOLED">
        <property name="driver" value="oracle.jdbc.driver.OracleDriver"/>
        <property name="url" value="jdbc:oracle:thin:@<host>:<port>/<sid>"/>
        <property name="username" value="<username>"/> ①
        <property name="password" value="<password>"/>
      </dataSource>
    </environment>
  </environments>
  <mappers>
    <mapper class="com.dena.mappers.denaDBM"/>
  </mappers>
</configuration>
```

① Specify your user name.

3. Specify the relevant parameters for the URL property:

Parameter	Description
<b>host</b>	Host name (or IP address) of the scoring database.
<b>port</b>	Port of the database.
<b>sid</b>	Unique name that identifies the instance of the connection.

See [Creating the base objects](#)

## 4.3. Creating the base objects

Base objects such as maps, rules, requests, and variables can be added to the database so that they are accessible from the console.

1. Access the `dena\db` folder.
2. Execute `fill_db.sql`

The relevant objects are created after the SQL script has completed.

## 4.4. Starting the user console

After the relevant database details have been configured, the user console can be started.

1. Access the UI folder.
2. To start the console, perform the action for the relevant operating system being used:

- **Windows** — double-click the `ui-con.bat` file
- **Unix** — execute the following command: `java -jar uicon.jar`

3. Open the console.

**NOTE**

Appending `-pws <host:port>` (or `-pws <IP address:port>`) to the Unix command enables it to be run as a web service.
